Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- 1. Reorient or relocate the receiving antenna.
- 2. Increase the separation between the equipment and receiver.
- 3. Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- 4. Consult the dealer or an experienced radio technician for help.

FCC Caution

This equipment must be installed and operated in accordance with provided instructions and a minimum 20 cm spacing must be provided between computer

mounted antenna and person's body (excluding extremities of hands, wrist and feet) during wireless modes of operation.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Any changes or modifications not expressly approved by the party responsible for compliance could void the authority to operate equipment.

Federal Communication Commission (FCC) Radiation Exposure Statement

This equipment complies with FCC radiation exposure set forth for an uncontrolled environment. In order to avoid the possibility of exceeding the FCC radio frequency exposure limits, human proximity to the antenna shall not be less than 20cm (8 inches) during normal operation.

The antenna(s) used for this transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

R&TTE Compliance Statement

This equipment complies with all the requirements of DIRECTIVE 1999/5/EC OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of March 9, 1999 on radio equipment and telecommunication terminal Equipment and the mutual recognition of their conformity (R&TTE)

The R&TTE Directive repeals and replaces in the directive 98/13/EEC (Telecommunications Terminal Equipment and Satellite Earth Station Equipment) As of April 8, 2000.

Safety

This equipment is designed with the utmost care for the safety of those who install and use it. However, special attention must be paid to the dangers of electric shock and static electricity when working with electrical equipment. All guidelines of this and of the computer manufacture must therefore be allowed at all times to ensure the safe use of the equipment.

EU Countries Intended for Use

The ETSI version of this device is intended for home and office use in Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, Sweden, and the United Kingdom. The ETSI version of this device is also authorized for use in EFTA member states: Iceland, Liechtenstein, Norway, and Switzerland.

EU Countries Not intended for use None.

1 Introduction

Thank you for purchasing the 802.11g Wireless LAN PCI Card. This card complies with IEEE 802.11g standard, which supports up to 54Mbps high-speed wireless network connections. It can also work with IEEE 802.11b devices. When the card connects to 11b devices, the link speed will be up to 11Mbps.

This card enables higher data throughput than the IEEE 802.11g standard (up to 54Mbps). It supports specific ways to increase the data transfer rate at a time; compress the data and decrease the waiting time to send the next data to the Routers or APs. This feature is called Turbo Mode. When the card is connecting to the Routers or APs with the proprietary Turbo Mode feature, the wireless network will be more effective.

For WLAN security issues, this card supports 64/128-bit WEP data encryption that protects your wireless network from eavesdropping. It also supports WPA (Wi-Fi Protected Access) feature that combines IEEE 802.1x and TKIP (Temporal Key Integrity Protocol) technologies. Client users are required to authorize before accessing to APs or AP Routers, and the data transmitted in the network is encrypted/decrypted by a dynamically changed secret key. Furthermore, this card supports WPA2 function, WPA2 provides a stronger encryption mechanism through AES (Advanced Encryption Standard), which is a requirement for some corporate and government users.

When you use the devices such as Voice over Internet Protocol (VoIP) phones, televisions, VCRs and MP3 players, how can you speed up the audio, video and voice data to pass through the wireless network? IEEE 802.11e Quality of Service (QoS) (The Wi-Fi Alliance defined WMM as a profile of the IEEE 802.11e) extensions for 802.11 networks will help to define the priorities of the data traffics by the data categories to provide enhanced multimedia support. This card supports the advanced technology for sure.

The power consumption of the card is also very low. This card provides several levels of power saving modes allowing user customizes the way of saving the power from his/her portable or handheld devices.

This card is cost-effective, together with the versatile features; it is the best solution for you to build your wireless network.

1.1 Features

- Works with both IEEE 802.11b and IEEE 802.11g products.
- High-speed transfer data rate up to 54Mbps.
- Supports Turbo Mode to enhance the data transfer speed within the specific wireless network.
- Supports WMM function to meet the multi-media data bandwidth requirement.
- Supports 64/128-bit WEP, WPA (TKIP with IEEE 802.1x), WPA2 (AES with IEEE 802.1x) functions for high level of security.
- Detachable antenna with long length cable provides convenience to locate the antenna.
- Automatic fallback increases data security and reliability.
- Supports the most popular operating system: Windows 98SE/Me/2000/XP.
- Supports 32-bit PCI interface.

1.2 Specifications

- Standard: IEEE 802.11b/g
- Interface: 32-bit PCI
- Frequency Band: 2.4000 ~ 2.4835GHz (Industrial Scientific Medical Band)
- Modulation: OFDM with BPSK, QPSK, 16QAM, 64QAM (11g)

BPSK, QPSK, CCK (11b)

- Data Rate: 54/48/36/24/18/12/11/9/6/5.5/2/1Mbps auto fallback
- Security: 64/128-bit WEP Data Encryption, WPA (TKIP with IEEE 802.1x), WPA2 (AES with IEEE 802.1x)

Note: WPA2 is enabled in Windows 2000/XP.

- Antenna: External detachable dipole antenna (Connector: RP-SMA connector, Cable Length: 94 cm)
- Drivers: Windows 98SE/Me/2000/XP
- LEDs: Link, TX/RXTransmit Power: 16dBm~18dBm
- Dimension: 19(H) x 130(W) x 121(D) mm
- Weight: 46g
- Temperature: 32~131°F (0 ~ 55°C)
- Humidity: Max. 95% (NonCondensing)
- Certification: FCC, CE

1.3 Package Contents

Before you begin the installation, please check the items of your package. The package should include

the following items:

- One PCI Card
- One CD (Driver/Utility/User's Manual.)
- One Quick Guide

If any of the above items is missing, contact your supplier as soon as possible.

2 Installation Procedure

Before you proceed with the installation, please notice following descriptions.

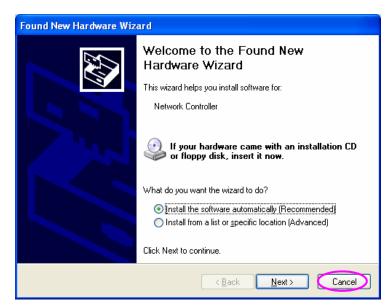

- Note1: The following installation was operated under Windows XP. (Procedures are similar for Windows 98SE/Me/2000.)
- Note2: If you have installed the Wireless PCI Card driver & utility before, please uninstall the old version first.

2.1 Install the Hardware

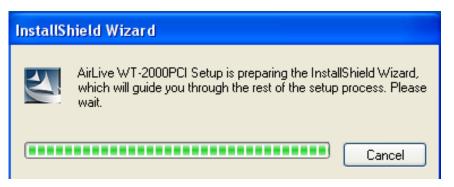

- A. Turn off your computer and remove its cover.
- B. Insert the PCI card to an available PCI slot firmly.
- C. Secure this card to the rear of the computer chassis and put back the cover.
- D. Secure the antenna to the antenna connector of the card.
- E. Turn on the computer.

2.2 Install the Driver and Utility

A. "Found New Hardware Wizard" is displayed after the PCI card is installed and the computer is restarted. Click "Cancel".

B. Insert the Installation CD to your CD-ROM Drive. Execute the "setup" program.

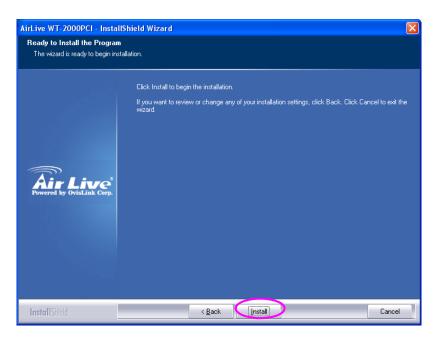

C. Click "Next" to process the installation if you accept the license agreement.

AirLive WT-2000PCI - InstallShield Wizard							
License Agreement Please read the following licens	e agreement carefully.

E. The system will automatically detect the card and display "Hardware Installation" screen. Click "Install" to continue.

F. Please click "Finish" to complete the installation.

3 Configuration Utility

The Configuration Utility is a powerful application that helps you configure the PCI card and monitor the link status and the statistics during the communication process.

When the card is installed, the configuration utility will be displayed automatically. This card will auto connect to wireless device which has better signal strength and no wireless security setting.

🛣 AirLive 802.11G Wireless Utility

-	Rescan	Add to Profil	e Con	nect						-

The Configuration Utility appears as an icon on the system tray of Windows while the card is running. You can open the utility by double-click on the icon.

Right click the icon, there are some items for you to operate the configuration utility.

- Lauch Config Utilities
 Select "Leuch Config Litilities" to and
- Select "Lauch Config Utilities" to open the Configuration Utility tool.
- Use Zero Configuration as Configuration Utility
- Select "Use Zero Configuration as Configuration Utility" to use Windows XP built-in wireless configuration utility (Windows Zero Configuration) to configure the card.
- Exit
 Select "Exit" to close the Configuration Utility tool.

In Windows XP, there is a "Windows Zero Configuration Tool" for you to setup wireless clients. By default, this "Windows Zero Configuration Tool" is enabled. If you want to use the Utility for the card, please follow one of the ways as below.

First Way

Right click the icon in the system tray and select "Use RaConfig as Configuration Utility".

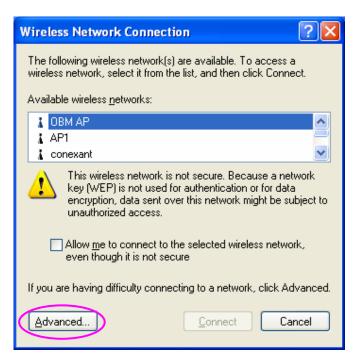

Launch Config Utilities	
Use AirLiveConfig as Configuration utility	F
Exit	L
	X,

Second Way

A. Right-click the icon and select "View Available Wireless Networks".

B. Click "Advanced".

C. Uncheck "Use Windows to configure my wireless network settings" to enable the utility for the card.

Note: If "Wireless Zero Configuration" is enabled, you can only configure the advance setting or check the link status and statistics from the configuration utility of the card.

3.1 Site Survey

When you open the Configuration Utility, the system will scan all the channels to find all the access points/stations within the accessible range of your card and automatically connect to the wireless device with the highest signal strength. From the "Site Survey", all the networks nearby will be listed. You can change the connection to another networks or add one of the networks to your own profile list.

Parameter	Description
Profile Name	Define a recognizable profile name for you to identify the different
	networks.
SSID	The SSID (up to 32 printable ASCII characters) is the unique name
	identified in a WLAN. The ID prevents the unintentional merging of two
	co-located WLANs.
	You may specify a SSID for the card and then only the device with the
	same SSID can interconnect to the card. If you want to add the network
	nearby to the profile list, pull down the menu, all the networks will be
	listed for you to add one of them to the profile list.
Parameter	Description
PSM (Power Saving Mode)	The power saving function is only available when the network type is in
	Infrastructure.
	CAM (Constantly Awake Mode) - The card will always set in active
	mode.
	PSM (Power Saving Mode) – Enable the card in the power saving
	mode when it is idle.
Network Type	Infrastructure – This operation mode requires the presence of an
	802.11 Access Point. All communication is done via the Access Point or
	Router.
	Ad-Hoc – Select this mode if you want to connect to another wireless
	stations in the Wireless LAN network without through an Access Point
	or Router.
TX Power	If you want to lower the transmit power of the card for saving the power
	of the system, you can select the lower percentages from the list. The
	lower power will cause the lower signal strength and the coverage
	range.
Ad Hoc Wireless Mode	When the card is set in Ad Hoc (Peer to Peer Mode), you can designate
	the wireless connection mode for the Ad Hoc network.
	the wireless connection mode for the Ad Hoc network. 802.11 B only – This card can be compatible with both 802.11g and
	802.11 B only – This card can be compatible with both 802.11g and
	802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in
	802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in the network, you can set the card to this mode.
	 802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in the network, you can set the card to this mode. 802.11 B/G mix – If you have a mix of 802.11b and 802.11g wireless
	 802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in the network, you can set the card to this mode. 802.11 B/G mix – If you have a mix of 802.11b and 802.11g wireless stations in your network, it is recommended to setting the card to this mode. This mode is also the default setting.
	 802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in the network, you can set the card to this mode. 802.11 B/G mix – If you have a mix of 802.11b and 802.11g wireless stations in your network, it is recommended to setting the card to this mode. This mode is also the default setting. 802.11 G only – This card can be compatible with both 802.11g and
	 802.11 B only – This card can be compatible with both 802.11g and 802.11b wireless stations. If there are only 802.11b wireless stations in the network, you can set the card to this mode. 802.11 B/G mix – If you have a mix of 802.11b and 802.11g wireless stations in your network, it is recommended to setting the card to this mode. This mode is also the default setting.

among wireless devices. This option is only active in the Ad Hoc network.

There are two modes including Auto and Long Preamble. If "Auto" mode is selected, the card will auto switch the preamble mode depending on the wireless devices the card is connecting to.

Parameter	Description
RTS Threshold	Minimum packet size required for an RTS (Request To Send). For
	packets smaller than this threshold, an RTS is not sent and the packet
	is transmitted directly to the wireless network. Select a setting within a
	range of 0 to 2347 bytes. Minor change is recommended.
Fragment Threshold	The value defines the maximum size of packets; any packet size larger
	than the value will be fragmented. If you have decreased this value and
	experience high packet error rates, you can increase it again, but it will
	likely decrease overall network performance. Select a setting within a
	range of 256 to 2346 bytes. Minor change is recommended.
Channel	This setting is only available for Ad Hoc mode. Select the number of the
	radio channel used for the networking. The channel setting should be
	the same with the network you are connecting to.

AirLive WT-2000PCI User's Manual

3.2.1.2 Authentication and Security

Parameter	Description
Authentication Type	This setting has to be consistent with the wireless networks that the card intends to connect.
	Open – No authentication is needed among the wireless network.
	Shared – Only wireless devices using a shared key (WEP Key
	identified) are allowed to connecting each other.
Parameter	Description
Authentication Type	LEAP – LEAP is a pre-EAP, Cisco-proprietary protocol, with many of the features of EAP protocols. Cisco controls the ability of other vendors to implement this protocol, so it should be selected for use only when limited vendor choice for client, access-point, and server products is not a concern. When you have set up LEAP authentication, you have to enter the user name and password of your computer.
	WPA – WPA provides a scheme of mutual authentication using either IEEE 802.1x/Extensible Authentication Protocol (EAP) authentication or pre-shared key (PSK) technology. It provides a high level of assurance to enterprises, small businesses and home users that data will remain protected and that only authorized users may access their networks. For enterprises that have already deployed IEEE 802.1x authentication, WPA offers the advantage of leveraging existing authentication databases and infrastructure.
	WPA-PSK – It is a special mode designed for home and small business users who do not have access to network authentication servers. In this mode, known as Pre-Shared Key, the user manually enters the starting password in their access point or gateway, as well as in each wireless stations in the network. WPA-PSK takes over automatically from that point, keeping unauthorized users that don't have the matching password from joining the network, while encrypting the data traveling between authorized devices.
	WPA2 – Like WPA, WPA2 supports IEEE 802.1x/EAP authentication or PSK technology. It also includes a new advanced encryption mechanism using the Advanced Encryption Standard (AES). AES is required to the corporate user or government users. The difference between WPA and WPA2 is that WPA2 provides data encryption via the AES. In contrast, WPA uses Temporal Key Integrity Protocol (TKIP).

	WPA2-PSK – WPA2-PSK is also for home and small business.
	The difference between WPA-PSK and WPA2-PSK is that
	WPA2-PSK provides data encryption via the AES. In contrast,
	WPA-PSK uses Temporal Key Integrity Protocol (TKIP).
802.1x Setting	When you have set the Authentication Type to Open, Shared,
	WPA or WPA2, you can also enable IEEE 802.1x setting to use
	the authentication server or certification server to authenticate
	client users.
Parameter	Description
Encryption Mode	None – Disable the encryption mode.
	WEP – Enable the WEP Data Encryption. When the item is
	selected, you have to continue setting the WEP Encryption keys.
	TKIP – TKIP (Temporal Key Integrity Protocol) changes the
	temporal key every 10,000 packets (a packet is a kind of message
	transmitted over a network.) This insures much greater security
	than the standard WEP security.
	AES – AES has been developed to ensure the highest degree of
	security and authenticity for digital information and it is the most
	advanced solution defined by IEEE 802.11i for the security in the
	wireless network.
	Note: All devices in the network should use the same encryption
	Note: All devices in the network should use the same encryption
	method to ensure the communication.
WPA Pre-Shared Key	The WPA-PSK key can be from 8 to 64 characters and can be
	letters or numbers. This same key must be used on all of the
	wireless stations in the network.
WEP Key	The WEP keys are used to encrypt data transmitted in the
(Key1 ~ Key4)	wireless network. There are two types of key length: 64-bit and
	128-bit. Select the default encryption key from Key 1 to Key 4 by
	selected the radio button.
	Fill the text box by following the rules below.
	64-bit – Input 10-digit Hex values (in the "A-F", "a-f" and "0-9"
	range) or 5-digit ASCII characters (including "a-z" and "0-9") as
	the encryption keys. For example: "0123456aef" or "test1".
	128-bit – Input 26-digit Hex values (in the "A-F", "a-f" and "0-9"
	range) or 13-digit ASCII characters (including "a-z" and "0-9") as
	the encryption keys. For example:
	"01234567890123456789abcdef" or "administrator".

The IEEE 802.1X specification describes a protocol that can be used for authenticating both clients and servers on a network. The authentication algorithms and methods are those provided by the Extensible Authentication Protocol (EAP), a method of authentication that has been in use for a number of years on networks that provide Point-to-Point Protocol (PPP) support as many internet service providers and enterprises do.

When an AP acting as an authenticator detects a wireless station on the LAN, it sends an EAP-Request for the user's identity to the device. (EAP, or the Extensible Authentication Protocol, is an authentication protocol that runs before network layer protocols transmit data over the link.) In turn, the device responds with its identity, and the AP relays this identity to an authentication server, which is typically an external RADIUS server.

An example for MD5 Authentication

3.2.1.3 802.1x Setting-Certification

Parameter	Description
Authentication Type	The EAP authentication protocols this card has supported are included as follows. This setting has to be consistent with the wireless APs or Routers that the card intends to connect.
	PEAP &TTLS – PEAP and TTLS are similar and easier than TLS in that they specify a stand-alone authentication protocol be used within an encrypted tunnel. TTLS supports any protocol within its tunnel, including CHAP, MS-CHAP, MS-CHAPv2, PAP and EAP-MD5. PEAP specifies that an EAP-compliant authentication protocol must be used; this card supports EAP-MSCHAP v2, EAP-TLS/Smart card and Generic Token Card. The client certificate is optional required for the authentication.
	TLS/Smart Card –TLS is the most secure of the EAP protocols but not easy to use. It requires that digital certificates be exchanged in the authentication phase. The server presents a certificate to the client. After validating the server's certificate, the client presents a client certificate to the server for validation.
	MD5-Challenge – MD5-Challenge is the easiest EAP Type. It requires the wireless station to enter a set of user name and password as the identity to RADIUS Server.
Session Resumption	There are "Disabled", "Reauthentication", "Roaming", "SameSsid" and "Always" selections for you to choose whether to recovery the session in different status.
Identity	Enter the name as the identity for the server.
Password	Enter the password as the identity for the server.
Use Client Certificate	A client certificate is required for TLS, and is optional for TTLS and PEAP. This forces a client certificate to be selected from the appropriate Windows Certificate Store and made available to the RADIUS server for certification.

Parameter	Description
Tunneled Authentication	
Protocol	When the authentication type is PEAP or TTLS, select a protocol
	to be used to build the encrypted tunnel.
Identity	This is the protected user EAP Identity used for authentication.
	The identity specified may contain up to 63 ASCII characters, is
	case sensitive and takes the form of a Network Access Identifier,
	consisting of <name of="" the="" user="">@<user's home="" realm="">. The</user's></name>
	user's home realm is optional and indicates the routing domain.
Password	The password used for authentication. It may contain up to 63
	ASCII characters and is case sensitive.

	ок	Cancel		

3.2.1.4 802.1x Setting-CA Server

Parameter	Description
Use Certificate Chain	When the EAP authentication type such as TLS, TTLS or PEAP is
	selected and required a certification to tell the client what server
	credentials to accept from the authentication server in order to
_	verify the server, you have to enable this function.
Certificate Issuer	Choose the server from the list to issue the certificate. If "Any
	Trusted CA" is selected, any CA included in the list (provided by
	the Microsoft Certificate Store) is permitted.

Parameter	Description
Allow Intermediate Certificates	A server designates an issuer as a trusted root authority by placing the issuer's self-signed certificate, which contains the issuer's public key, into the trusted root certification authority certificate store of the host computer. Intermediate or subordinate certification authorities are trusted only if they have a valid certification path from a trusted root certification authority.
Server Name	Enter the authentication server name.
Server name must match exactly	When selected, the server name must match exactly the server name found on the certificate.
Domain name must end in specified name	When selected, the server name field identifies a domain. The certificate must use a server name belonging to this domain or to one of its sub-domains (e.g. zeelans.com, where the server is blueberry.zeelans.com) but it may be any name used in the certificate name field.

From the "Link Status" option, you can view all the information of the network you are connecting to.

Parameter	Description
Status	Display the SSID and MAC ID of the network the card is
	connecting to.
Extra Info	Display the link status.
Channel	Display the number of the radio channel and the frequency used
	for the networking.
Link Speed (Mbps)	Display the transmission and reception rate of the network. The
	maximum transmission rate is 54Mbps.
Throughput (Kbits/sec)	Display the speed of data transmitted and received.
Link Quality	This bar indicates the quality of the link. The higher the
	percentage, the better the quality.
dBm	If you want to know the signal strength in the unit of dBm, select
	this check box.
Signal Strength	This bar shows the signal strength level. The higher percentage
	shown in the bar, the more radio signal been received by the card.
	This indicator helps to find the proper position of the wireless
	device for quality network operation.
Noise Level	Display the noise level in the wireless environment.

3.4 Statistics

This option enables you to view the statistic information of the connection including transmit statistics and receive statistics. You may reset the counters by clicking "Reset Counter".

Parameter	Description
Wireless Mode	802.11 B/G mix – If you have a mix of 802.11b and 802.11g
	wireless stations in your network, it is recommended to setting the
	card to this mode. This mode is also the default setting.
	802.11 B only – This card can be compatible with both 802.11g
	and 802.11b wireless stations. If there are only 802.11b wireless
	stations in the network, you can set the card to this mode.
	802.11 G only – This card can be compatible with both 802.11g
	and 802.11b wireless stations. If there are only 802.11g wireless
	stations in the network, you can set the card to this mode.
Select Your Country Region Code	The available channel differs from different countries. For
	example: USA (FCC) is channel 1-11, Europe (ETSI) is channel
	1-13. The operating frequency channel will be restricted to the
	country user located before importing. If you are in different
	country, you have to adjust the channel setting to comply the
	regulation of the country.
B/G Protection	If you have a mix of 802.11b and 802.11g wireless stations in the
	network, it is recommended to enable the protection mechanism.
	This mechanism can decrease the rate of data collision between
	802.11b and 802.11g wireless stations. When the protection mode
	is enabled, the throughput of the card will be a little lower due to
	many of frame traffic should be transmitted.
	Auto – Based on the status of the network and automatically
	disable/enable protection mode.
	On – Always enable the protection mode.
	Off – Always disable the protection mode.
Tx Rate	There are several options including
	Auto/1/2/5.5/11/6/9/12/18/24/36/48/54Mbps for you to select.
	When the "Auto" is selected, the device will choose the most
	suitable transmission rate automatically. The higher data rate you
	designated in the network, the shorter distance is allowed
	between the card and the wireless stations.
	When the wireless mode is "802.11 B only", the maximum data
	rate is 11Mbps (11b) so that there are only "Auto/1/2/5.5/11Mbps" options you can select.
Tx BURST	Tx Burst enables the card to deliver the better throughput in the
	same period and environment.

Parameter	Description			
Enable TCP Window Size	The TCP Window is the amount of data a sender can send on a particular connection before it gets an acknowledgment back fror			
	the receiver that it has gotten some of it. When the Router or AP			
	the card is connecting to have set up the TCP Window, you can			
	enable the parameter to meet the data size for the Router or AP			
	connection. The larger TCP Window the better performance.			
Fast Roaming at -70dBm	When you want to fast roaming to the network nearby without			
	intercepting the wireless connection especially the card is applied			
	to the multimedia application or a voice call, you can enable the			
	parameter. The card will fast roaming to the near network when			
	the receive sensitivity (signal strength) is lower to the value you			
	have set up.			
Turn Off RF Button	If you want to turn off the radio of the card temporarily, click this			
	button. To turn on the radio, click this button again.			
CCX 2.0	CCX 2.0 (Cisco Compatible Extensions) is developed by Cisco for			
	the radio monitoring and fast roaming.			
LEAP Turn on CCKM	During normal operation, LEAP-enabled client devices mutually			
	authenticate with a new access point by performing a complete			
	LEAP authentication, including communication with the main			
	RADIUS server.			
	When you configure your wireless LAN for fast re-association,			
	however, LEAP-enabled client devices roam from one access			
	point to another without involving the main server. Using Cisco			
	Centralized Key Management (CCKM), an access point			
	configured to provide Wireless Domain Services (WDS) takes the			
	place of the RADIUS server and authenticates the client so			
	quickly that there is no perceptible delay in voice or other			
	time-sensitive applications.			
Enable Radio Measurement	When this parameter is enabled, the Cisco AP can run the radio			
	monitoring through the associated CCX-compliant clients to			
	continuously monitor the WLAN radio environment and discover			
	any new APs that are transmitting beacons.			
Non-Serving Channel	The Cisco AP can perform monitoring measurements through the			
Measurements	CCX-compliant clients on the non-serving channels when this			
	parameter is enabled.			
Limit xxx milliseconds (0-2000)	It limits the channel measurement time. The default value is 250 milliseconds.			

3.6 About

By choosing this option, you can click the hyperlink to connect the website for the information of the wireless chipset vendor and review basic information about the Utility such as the Driver, Utility and EEPROM Version. The MAC Address of the card is displayed in the screen as well.

3.7 Turbo Mode

This card supports specific ways to increase the data transfer rate at a time; compress the data and decrease the waiting time to send the next data to the Routers or APs, this feature (known as Turbo Mode) enables higher throughput than IEEE 802.11g standard (Up to 54Mbps).

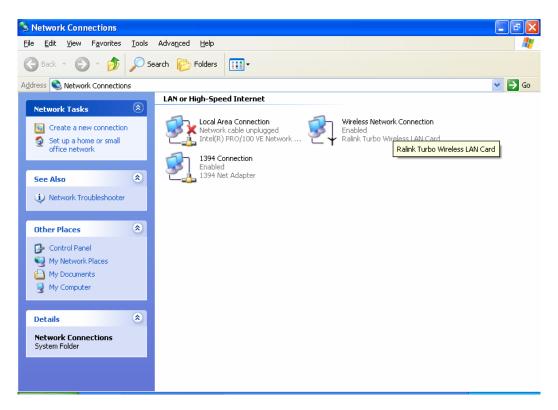

When the card is connecting to the Routers or APs with the proprietary Turbo Mode feature, the Turbo Mode will be enabled automatically without any configuration.

3.8 WMM Function

In addition to the Turbo Mode, this card also supports WMM function. When you use the devices such as Voice over Internet Protocol (VoIP) phones, televisions, VCRs and MP3 players, IEEE 802.11e Quality of Service (QoS) (The Wi-Fi Alliance defined WMM as a profile of the IEEE 802.11e) extensions for 802.11 networks will help to define the priorities of the data traffics by the data categories to provide enhanced multimedia support.

When the card is connected to the AP or Router with WMM function, you can enable the function of the card by following the steps below.

A. In the Desktop of the computer, right click "My Network Places" and select "Properties".

- B. Right Click the "Wireless Network Connection" and select "Properties".
- C. Click "Configure...".

4 Troubleshooting

This chapter provides solutions to problems usually encountered during the installation and operation of the adapter.

1. What is the IEEE 802.11g standard?

802.11g is the new IEEE standard for high-speed wireless LAN communications that provides for up to 54 Mbps data rate in the 2.4 GHz band. 802.11g is quickly becoming the next mainstream wireless LAN technology for the home, office and public networks. 802.11g defines the use of the same OFDM modulation technique specified in IEEE 802.11a for the 5 GHz frequency band and applies it in the same 2.4 GHz frequency band as IEEE 802.11b. The 802.11g standard requires backward compatibility with 802.11b.

The standard specifically calls for:

- A. A new physical layer for the 802.11 Medium Access Control (MAC) in the 2.4 GHz frequency band, known as the extended rate PHY (ERP). The ERP adds OFDM as a mandatory new coding scheme for 6, 12 and 24 Mbps (mandatory speeds), and 18, 36, 48 and 54 Mbps (optional speeds). The ERP includes the modulation schemes found in 802.11b including CCK for 11 and 5.5 Mbps and Barker code modulation for 2 and 1 Mbps.
- B. A protection mechanism called RTS/CTS that governs how 802.11g devices and 802.11b devices interoperate.

2. What is the IEEE 802.11b standard?

The IEEE 802.11b Wireless LAN standard subcommittee, which formulates the standard for the industry. The objective is to enable wireless LAN hardware from different manufactures to communicate.

3. What does IEEE 802.11 feature support ?

The product supports the following IEEE 802.11 functions:

- CSMA/CA plus Acknowledge Protocol
- Multi-Channel Roaming
- Automatic Rate Selection
- RTS/CTS Feature
- Fragmentation
- Power Management

4. What is Ad-hoc?

An Ad-hoc integrated wireless LAN is a group of computers, each has a Wireless LAN adapter, Connected as an independent wireless LAN. Ad hoc wireless LAN is applicable at a departmental scale for a branch or SOHO operation.

5. What is Infrastructure ?

An integrated wireless and wireless and wired LAN is called an Infrastructure configuration. Infrastructure is applicable to enterprise scale for wireless access to central database, or wireless application for mobile workers.

AirLive WT-2000PCI User's Manual

6. What is BSS ID ?

A specific Ad hoc LAN is called a Basic Service Set (BSS). Computers in a BSS must be configured with the same BSS ID.

7. What is WEP ?

WEP is Wired Equivalent Privacy, a data privacy mechanism based on a 40 bit shared key algorithm, as described in the IEEE 802 .11 standard.

8. What is TKIP?

TKIP is a quick-fix method to quickly overcome the inherent weaknesses in WEP security, especially the reuse of encryption keys. TKIP is involved in the IEEE 802.11i WLAN security standard, and the specification might be officially released by early 2003.

9. What is AES?

AES (Advanced Encryption Standard), a chip-based security, has been developed to ensure the highest degree of security and authenticity for digital information, wherever and however communicated or stored, while making more efficient use of hardware and/or software than previous encryption standards. It is also included in IEEE 802.11i standard. Compare with AES, TKIP is a temporary protocol for replacing WEP security until manufacturers implement AES at the hardware level.

10. Can Wireless products support printer sharing ?

Wireless products perform the same function as LAN products. Therefore, Wireless products can work with Netware, Windows 2000, or other LAN operating systems to support printer or file sharing.

11. Would the information be intercepted while transmitting on air?

WLAN features two-fold protection in security. On the hardware side, as with Direct Sequence Spread Spectrum technology, it has the inherent security feature of scrambling. On the software side, WLAN series offer the encryption function (WEP) to enhance security and Access Control. Users can set it up depending upon their needs.

12. What is DSSS ? What is FHSS ? And what are their differences ?

Frequency-hopping spread-spectrum (FHSS) uses a narrowband carrier that changes frequency in a pattern that is known to both transmitter and receiver. Properly synchronized, the net effect is to maintain a single logical channel. To an unintended receiver, FHSS appears to be short-duration impulse noise. Direct-sequence spread-spectrum (DSSS) generates a redundant bit pattern for each bit to be transmitted. This bit pattern is called a chip (or chipping code). The longer the chip is, the greater the probability that the original data can be recovered. Even if one or more bits in the chip are damaged during transmission, statistical techniques embedded in the radio can recover the original data without-the need for retransmission. To an unintended receiver, DSSS appears as low power wideband noise and is rejected (ignored) by most narrowband receivers.

13. What is Spread Spectrum ?

Spread Spectrum technology is a wideband radio frequency technique developed by the military for use in reliable, secure, mission-critical communication systems. It is designed to trade off bandwidth efficiency for reliability, integrity, and security. In other words, more bandwidth is consumed than in the case of narrowband transmission, but the trade off produces a signal that is, in effect, louder and thus easier to detect, provided that the receiver knows the parameters of the spread-spectrum signal being broadcast. If a receiver is not tuned to the right frequency, a spread –spectrum signal looks like background noise. There are two main alternatives, Direct Sequence Spread Spectrum (DSSS) and Frequency Hopping Spread Spectrum (FHSS).
