

Q: My ISP disconnect the ADSL connection frequently, how can I make my router to reconnect automatically?

A: You need to turn on the "Automatic Reconnect" option on the router. Please follow the steps below:

1. Open your web browser and type in the **router's IP address** (for example, 10.0.0.2)
2. When asked for Login and Password, Enter:
 - Login: **admin**
 - Password: **epicrouter**
3. Under "**Configuration -> WAN**". Check the "**Automatic Reconnect**" box under the PPP option.

The screenshot shows the OvisLink router configuration interface. On the left is a navigation menu with 'Status' and 'Configuration' sections. Under 'Configuration', 'WAN' is highlighted with a red box. The main content area shows the 'PPP' configuration section, where 'Automatic Reconnect' is checked and highlighted with a red box. Other fields include Service Name, Username, Password, Disconnect Timeout (0 seconds), MRU (1492), MTU (1492), MSS (1432), and Authentication (Auto). Below the PPP section is the 'DHCP' section with 'DHCP client enable' unchecked. At the bottom right, there is a 'Save Settings' button.

4. Press the "Submit" button first (all the way on the bottom), then press "Save Settings". The router should reboot to the new configuration.
